

I would oppose the way the government having access to wiretap type priveleges for data communication. That in my opinion is far from being kosher or on the level and working with the internet it is impossible once in a system and sniffing packets to differentiate whose packts you are receiving and would simply be able to open any ones mail/data/voice streams without any safeguards. When people are using these forms of communications they do have an expectation of privacy especially if they aren't committing any criminal acts, the other thing is that someone involved in many types of criminal acts would most likely use a peer to peer encryption method which snooping via packets alone would be useless to intercept and more closely be simply monitoring the entire united states.
